

Avior Laser System for MIG 29K

Acting in close cooperation with the Russian aircraft manufacturer MiG, Rheinmetall Defence Electronics is currently integrating a full-mission simulator containing the Avior® laser system as well as a 6DOF motion system for the carrier variant of MiG 29K fighter planes.

Based on this technology the laser projection system ensures exceptionally high degree of realism in simulating take-offs and landings on an aircraft carrier. In simulating a night landing, for example, the lights of the runway can be simulated extremely vividly.

Owing to the enhanced image contrast, the Avior® laser projection system depicts the day and night view much more realistically than other systems.
